

Weekly Watch Pipeline

How the Tuesday scheduled task actually runs, from the moment it fires to the moment a drafted application is sitting on disk, unsubmitted. **One rule holds at every stage:** the pipeline drafts and stops — you're the only one who ever clicks submit.

- Automated step**
Runs unattended — the orchestrator or one of its subagents.
- Human decision point**
Execution pauses here for an explicit reply.
- Guardrail stop**
The one line the pipeline never crosses on its own.

What the labels mean

Orchestrator	Not a special named agent — it's the plain default Claude session the scheduled task starts, the claude type in the Agent tool's own list. It just happens to start from a written prompt instead of a typed one.
Subagent	Spawned by the orchestrator via the Agent tool so all five run at once instead of one after another — the four track researchers plus platform search. Each is a general-purpose agent , given only the tools its one job needs.
Skill	The tool or capability a step actually leans on — WebSearch for research, the xlsx skill for spreadsheet edits, the docx skill for the resume and cover letter, Claude in Chrome for anything browser-based.
